# Clinical Tools

---

These clinical genetic tools can inform clinical decisions and diagnoses. These tools do not predict increased risk for disease.

## **Alanine Aminotransferase Activity (GPT)**

 Svinnri's Rewrite Arcanine Suicune's baseline ALT level is Low Normal

### **Why is this important to your vet?**

Svinnri's Rewrite Arcanine Suicune has one copy of a variant associated with reduced ALT activity as measured on veterinary blood chemistry panels. Please inform your veterinarian that Svinnri's Rewrite Arcanine Suicune has this genotype, as ALT is often used as an indicator of liver health and Svinnri's Rewrite Arcanine Suicune is likely to have a lower than average resting ALT activity. As such, an increase in Svinnri's Rewrite Arcanine Suicune's ALT activity could be evidence of liver damage, even if it is within normal limits by standard ALT reference ranges.

### **What is Alanine Aminotransferase Activity?**

Alanine aminotransferase (ALT) is a clinical tool that can be used by veterinarians to better monitor liver health. This result is not associated with liver disease. ALT is one of several values veterinarians measure on routine blood work to evaluate the liver. It is a naturally occurring enzyme located in liver cells that helps break down protein. When the liver is damaged or inflamed, ALT is released into the bloodstream.

### **How vets diagnose this condition**

Genetic testing is the only way to provide your veterinarian with this clinical tool.

### **How this condition is treated**

Veterinarians may recommend blood work to establish a baseline ALT value for healthy dogs with one or two copies of this variant.

# Health Report

## How to interpret Svinnri's Rewrite Arcanine Suicune's genetic health results:

If Svinnri's Rewrite Arcanine Suicune inherited any of the variants that we tested, they will be listed at the top of the Health Report section, along with a description of how to interpret this result. We also include all of the variants that we tested Svinnri's Rewrite Arcanine Suicune for that we did not detect the risk variant for.

## A genetic test is not a diagnosis

This genetic test does not diagnose a disease. Please talk to your vet about your dog's genetic results, or if you think that your pet may have a health condition or disease.

### Good news!

Svinnri's Rewrite Arcanine Suicune is not at increased risk for the genetic health conditions that Embark tests.

# Genetic Diversity and Inbreeding

## Coefficient of Inbreeding (COI)

**Genetic Result: 8%**

Our genetic COI measures the proportion of your dog's genome (her genes) where the genes on the mother's side are identical by descent to those on the father's side. The higher your dog's coefficient of inbreeding (the percentage), the more inbred your dog is.

### Your Dog's COI

This graph represents where your dog's inbreeding levels fall on a scale compared to both dogs with a similar breed makeup to her (the yellow dotted line) and all purebred dogs (the grey line).

## More on the Science

Embark scientists, along with our research partners at Cornell University, have shown the impact of inbreeding on longevity and fertility and developed a state-of-the-art, peer-reviewed method for accurately measuring COI and predicting average COI in litters.
